Streaming through the RTMP proxy — user guide

This server sits between your streaming software and YouTube. You send your stream here, and it forwards it on. You get one address to configure once, and a dashboard to see whether you are live.

Dashboard: <https://r.marav.top/>

1. Sign in

Your administrator creates and give you your account and gives you a username and password.

2. Create an API key

An **API key** is your password for streaming. Everything you send has to carry one. On the dashboard, find **Your keys** at the bottom, type a label that reminds you which machine it is for — **Studio PC** , **Laptop** — and press **Create key**. Leave the two optional destination fields blank.

Most accounts can hold **two** keys. Ask an administrator if you need more.

3. Copy your Server address

As soon as the key is created, the page shows it **once**:

Press **COPY** next to **Server**. That URL already contains your API key — it is the only thing you need to paste.

This is shown once and never again. The server stores only a scrambled version, so it cannot show it to you later. If you lose it, press **Rotate** on the key to get a new one. Treat the Server URL like a password. Anyone who has it can stream through your account.

4. Set up OBS

Settings → Stream → Service: **Custom...**

Field	What to put
Server	The URL you just copied, e.g. <code>rtmps://r.marav.top:4443/live?key=YOUR-API-KEY</code>
Stream Key	Your YouTube stream key — the one YouTube gives you
Use authentication	Leave unchecked

Press **OK**, then **Start Streaming**.

Two things worth knowing:

- Use the `rtmps://` address (port 4443) rather than `rtmp://` (port 4001) where you can. `rtmps` is encrypted, so nobody on your network can read your keys.
- **Leave "Use authentication" unchecked.** It looks like it should hold your API key, but it does not work with this server. Your key goes in the Server field.

5. Changing your YouTube stream key

This is the part that saves you time. When YouTube gives you a new stream key: **Change it in OBS. That's it.** Paste the new key into OBS's **Stream Key** box and carry on. You do not need to sign in here or change anything on the dashboard. The **Server** field stays exactly as it is, forever, unless you rotate your API key.

6. Check that you are live

The dashboard shows your stream within a few seconds of starting. It refreshes on its own.

Column	Meaning
Stream	Your stream key, mostly hidden, and the address you are connecting from
Uptime	How long you have been streaming
Bitrate	How much data is arriving. If this is far below what you set in OBS, your upload is struggling
Video	Resolution and frame rate the server is receiving
Forwarding to	Where your stream is being sent, and whether that is working. running is what you want
Kill	Stops the stream immediately

(The screenshot was taken on a test setup, so "Forwarding to" shows a local test address. Yours will show YouTube.)

If **Forwarding to** says **retrying**, the stream is reaching this server fine but cannot get into YouTube — nearly always a wrong or expired YouTube stream key. Check the key in OBS.

7. Managing your keys

Button	What it does
Pause	Temporarily blocks the key. Any stream using it stops immediately. Use this if you think someone else has your key
Rotate	Issues a new secret for the same key. The old one stops working at once, and you get a new Server URL to paste into OBS
Delete	Removes the key permanently

Last used tells you when a key last carried a stream — handy for spotting a key you no longer need, or one being used when it shouldn't be.

Troubleshooting

OBS says "Failed to connect to server"

- Check the **Server** field is complete, including the `?key=...` at the end. It is easy to cut off when copying by hand — use the **COPY** button.
- Check your key is not **paused** on the dashboard.

OBS connects, but nothing appears on YouTube

- Your stream is reaching this server but not YouTube. Look at **Forwarding to** on the dashboard. If it says **retrying**, the YouTube stream key in OBS is wrong or expired.

"Stream already publishing"

- Something is already streaming with that same YouTube stream key. Press **Kill** on the dashboard and start again.

Nothing appears on the dashboard at all

- The connection was rejected before it started, which almost always means the API key is wrong, paused, or deleted. Rotate the key and paste the new Server URL into OBS.

I lost my Server URL

- Press **Rotate** on the key. You get a new one immediately. Remember to update OBS.

Keeping things safe

- The **Server URL contains your API key**, so it is a secret. Do not paste it into chats or screenshots. Note that OBS shows the Server field as plain text on screen, unlike the Stream Key field, so be careful when sharing your screen.
- Prefer the `rtmps://` address. The plain `rtmp://` one sends your keys unencrypted.
- If you think a key has leaked, press **Rotate** — it takes a second and immediately kills anything using the old one.
